

# Exploratory Testing

ENGI- 9839

## Example

**Scenario:** You are a QA Engineer testing the **Collaborative Playlist Ecosystem** on the **Spotify app**. Your manager schedules a **90-minute Session-Based Exploratory Testing window** and instructs you to use James Whittaker's "**City Tour**" **Metaphor** to find hidden defects.

## Tasks Required:

**Part A:** Define a **Testing Charter** and write a 1-sentence charter for this Spotify playlist session.

**Part B:** Match the following 7 testing scenarios to their correct **Whittaker Tour**. For each, provide the **Name of the Tour** and a **1-sentence structural justification** explaining the system risk being checked.

## Example

- *Scenario 1:* You verify playlist folders, font sizes, and album art layout correctly when shifting screens from an iPhone to a desktop app.
- *Scenario 2:* You check what happens to the database if a user leaves the playlist title blank and repeatedly clicks "Create Playlist."
- *Scenario 3:* You track a single newly added song from the moment a user clicks "Add to Playlist" on a phone, through the cloud API, until it updates on a friend's computer.
- *Scenario 4:* You start downloading a massive 500-song playlist for offline listening, and then abruptly hit the "Cancel" button 3 seconds into the download.

## Example

- *Scenario 5:* You input thousands of strange emojis into a playlist name and suddenly drop the device's internet connection mid-save to see if the app crashes.
- *Scenario 6:* You want to check if the Spotify app can still successfully open, read, and play local .mp3 audio files stored on a user's physical hard drive, and see if those old local tracks can be seamlessly added into a modern, cloud-synced collaborative playlist.
- *Scenario 7:* You open the Spotify app on a test phone, start playing a continuous 24-hour global top-hits playlist with crossfade enabled, and leave the device running untouched on a desk overnight to monitor its performance.

### Part A: Session Charter

- **Definition:** A Testing Charter is a goal-oriented, time-boxed statement of purpose that defines the scope, target features, and potential hazards of an exploratory testing session without restricting the tester to a rigid, step-by-step script.
- **Spotify Charter Example:** *"Explore custom playlist creation and sharing across mobile and desktop platforms using diverse metadata inputs to discover database synchronization latencies and user interface format breaks."*

## ExampleSolution

### Part B: Whittaker's City Tours Application

#### 1. Scenario 1 = The Supermodel Tour

- **Spotify-Specific Justification:** This tour focuses exclusively on the Graphical User Interface (GUI) layout and visual rendering across different device viewports rather than backend streaming logic.
- **Specific System Risk Checked:** It ensures that when shifting from a phone to a desktop screen, Spotify's UI components such as the collaborative "Invite" button, playlist folder hierarchies, and album art grid layouts; render responsively without overlapping, clipping, or blocking the user from clicking interactive playback elements.
